NIH K23AG059890; “Individual and Community Drivers of Hospitalization among Older Adults after Natural Disaster,” role: PI

# Individual and Community Drivers of Hospitalization among Older Adults after Disaster

**Aim 1: Chronic disease care after disaster to avoid hospitalization.**

**Aim 2: Community resilience to improve health outcomes.**

**Aim 3: Strategies to promote aging in place after disaster.**

# There's no such thing as a Natural Disaster.

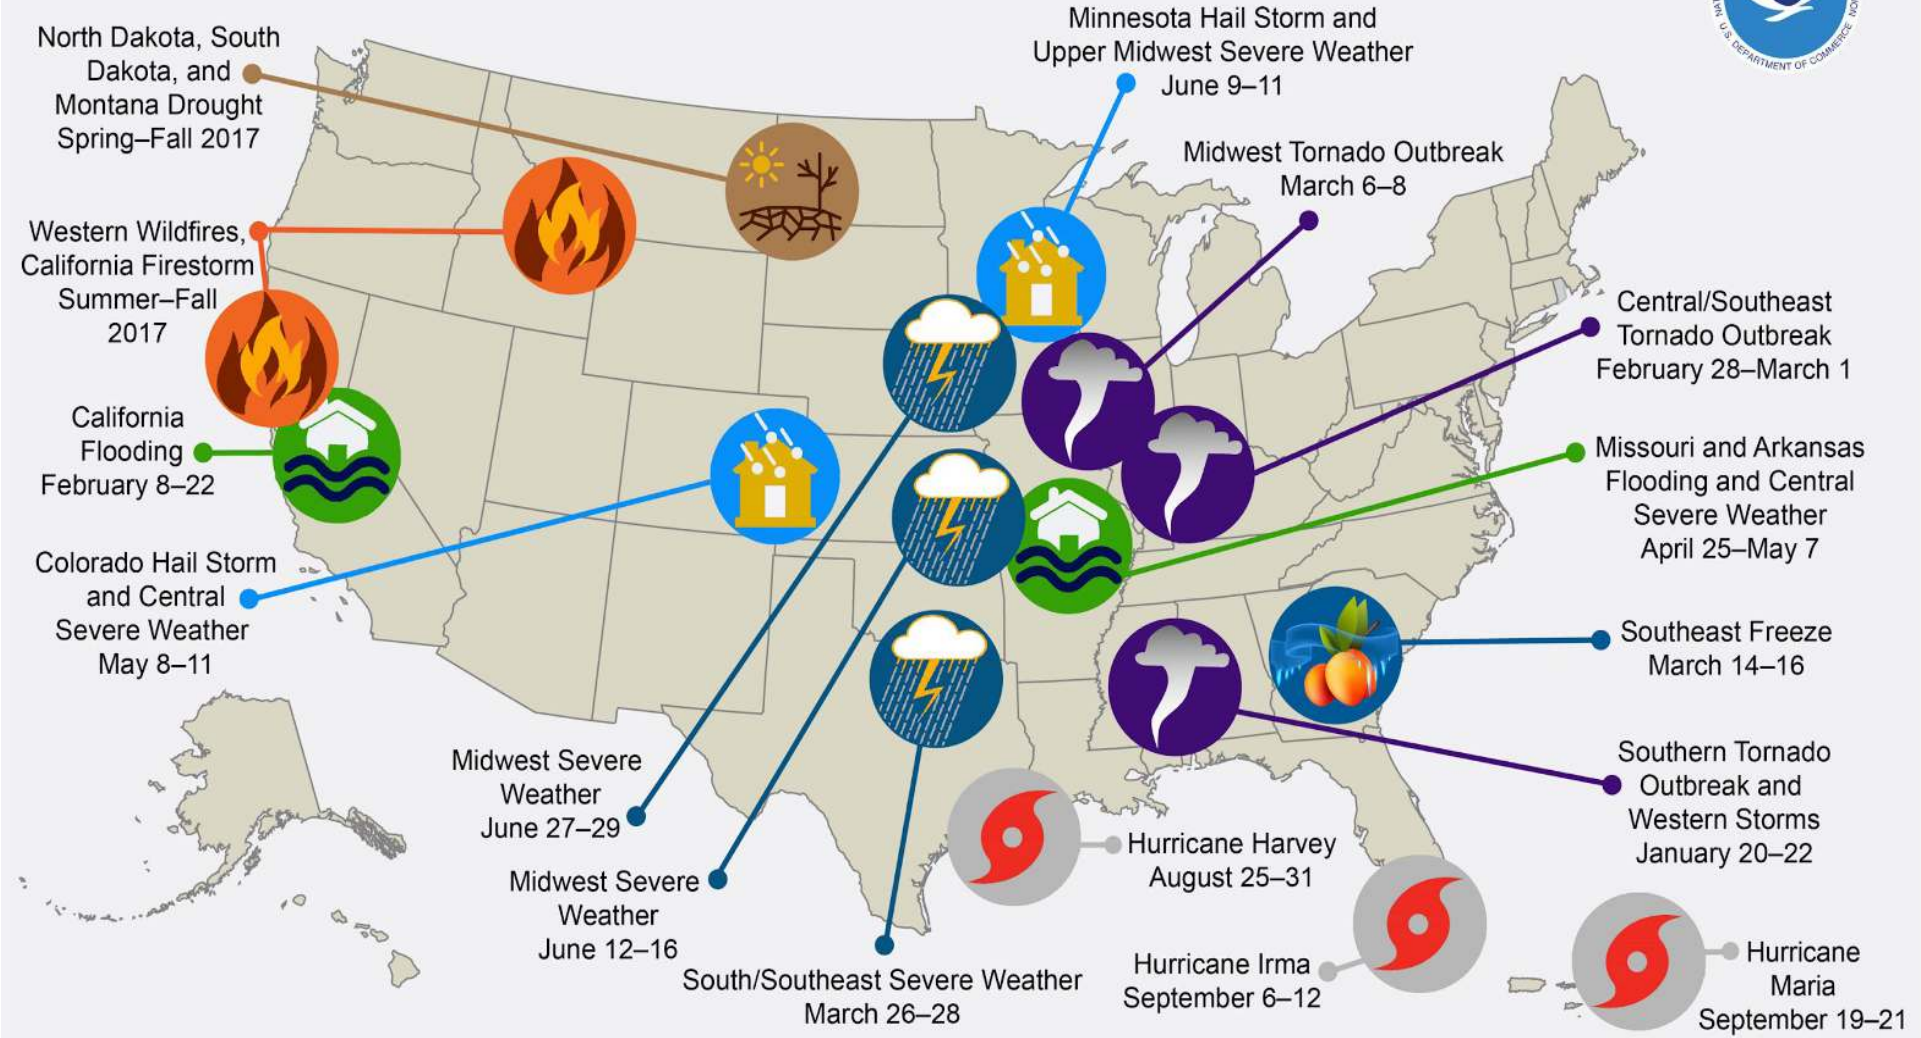

Hazards are natural. Disasters are human-made.

# U.S. 2017 Billion-Dollar Weather and Climate Disasters

*This map denotes the approximate location for each of the 16 billion-dollar weather and climate disasters that impacted the United States during 2017.*

Disasters  
disproportionately affect  
vulnerable populations.

# Disaster definition

$$\frac{(\text{Vulnerability} + \text{Hazard})}{\text{Capacity}} = \text{Disaster}$$

# Chronic and Comorbid Disease

$$\frac{(\text{Vulnerability} + \text{Hazard})}{\text{Capacity}} = \text{Disaster}$$

**Frailty**

**Social Isolation**

**Cognitive Impairment**

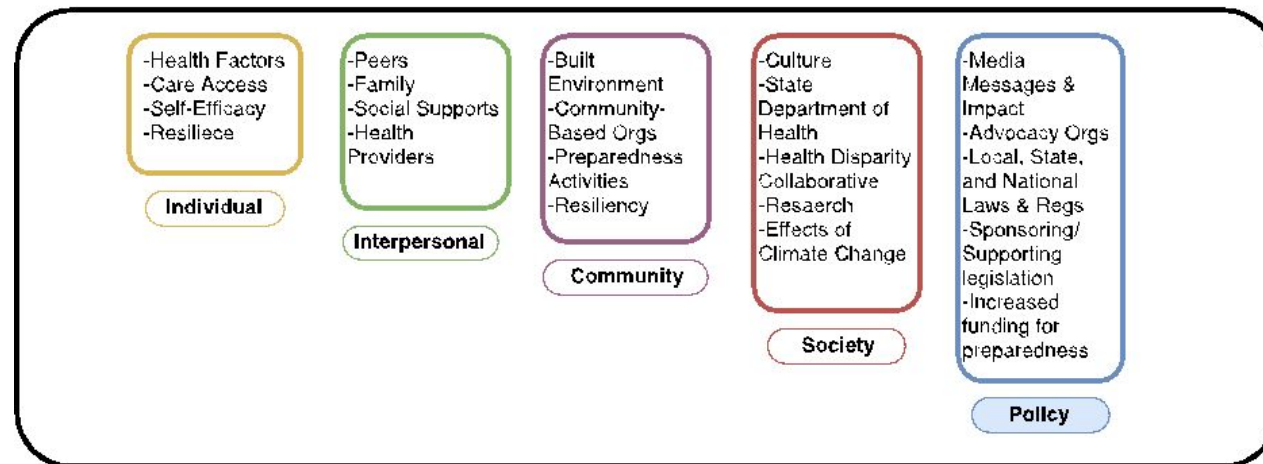

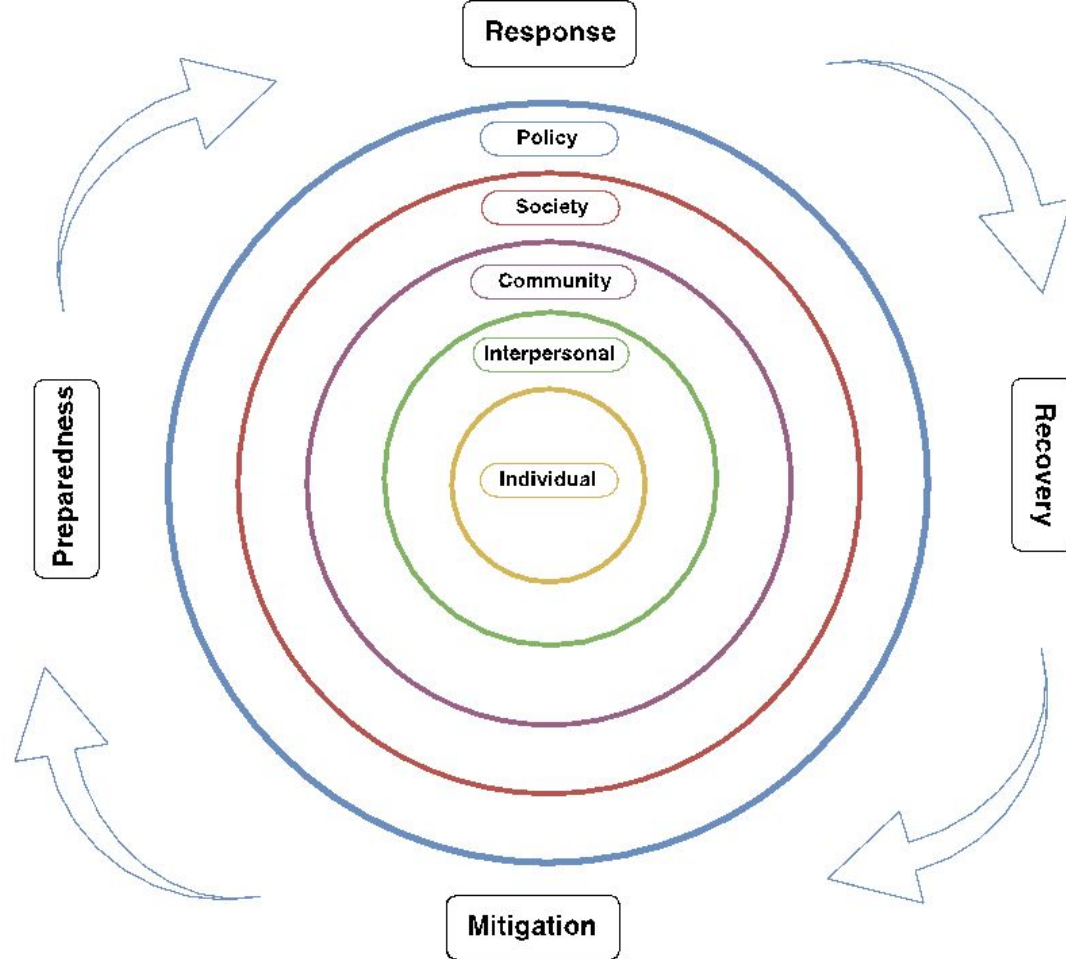

# **Disasters exacerbate existing vulnerabilities for older adults.**

Community supports are interrupted.

Health care services are disrupted.

Loss of basic infrastructure affects chronic disease processes.

# Opportunities and challenges

*"We fail to evacuate when advised. We rebuild in flood zones. We don't wear helmets. We fail to purchase insurance. We would rather avoid the risk of "crying wolf" than sound an alarm."*

We don't conduct data-driven research to understand the effects of disasters on population health.

# Opportunities and Challenges

## Research challenges:

- Reliance on cross-sectional or anecdotal accounts of individual disasters
- Little linkage to generalizable knowledge about after effects of disasters
- Linking large datasets to specific disasters

“Disaster research does not necessarily require a disaster. Available data should be mined to understand the impact of disasters on the elderly population. These include data from Medicare’s home health care payment program and other home health agencies that are required to undertake a similar assessment.”

## All-Cause Hospital Admissions Among Older Adults After a Natural Disaster

Sue Anne Bell, PhD, FNP-BC\*; Mahshid Abir, MD; HwaJung Choi, PhD; Colin Cooke, MD; Theodore Iwashyna, MD, PhD

*\*Corresponding Author. E-mail: [sabell@umich.edu](mailto:sabell@umich.edu), Twitter: [@sueannebell](https://twitter.com/sueannebell).*

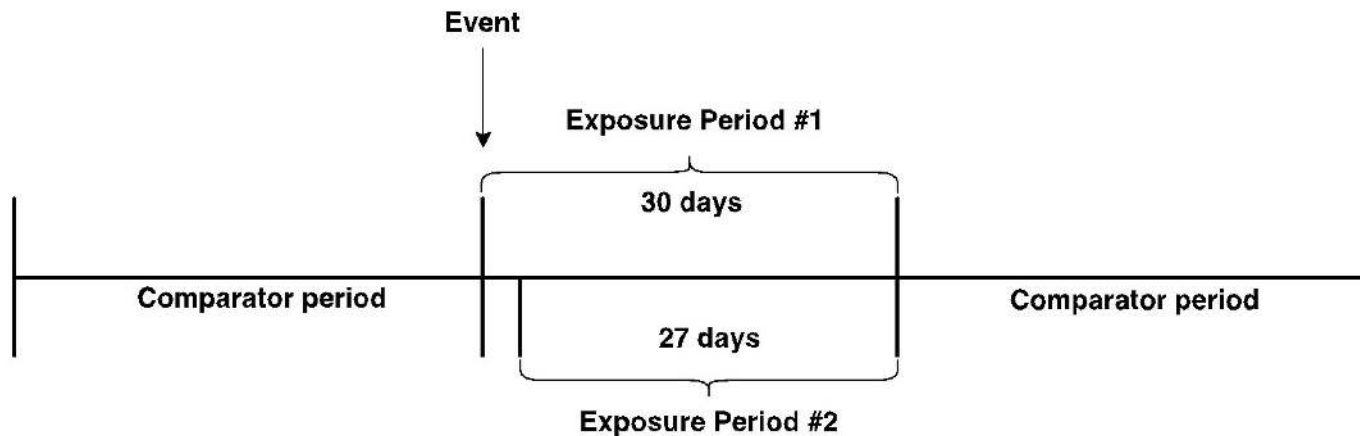

# Setting: 2011 Southeast Superstorm

n=28,475

# Methods

- Data source: MedPAR
- Self Controlled Case Series
- Individuals serve as their own controls and confounders are controlled for within the modeling
- Analysis based on when an event happened

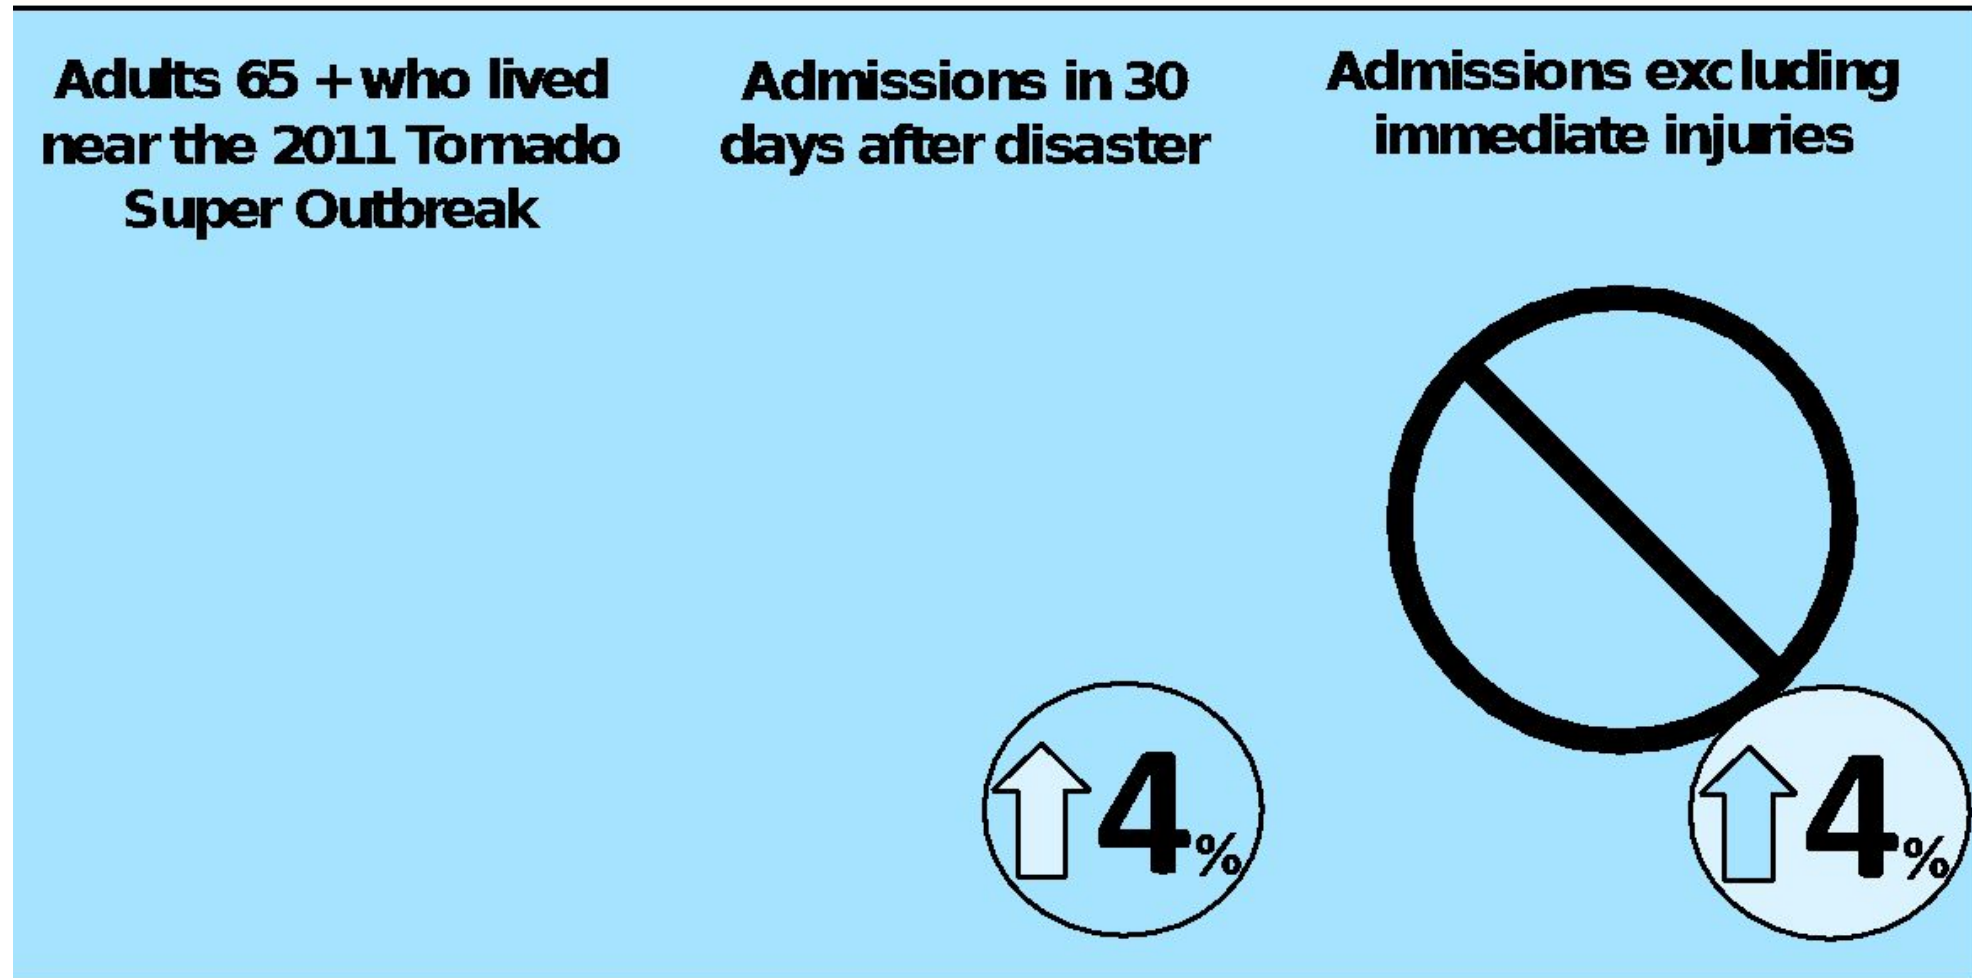

# Hospitalizations for older adults increased significantly in the month after one major disaster.

PreHospital and Disaster Medicine.

# Research Question: Do health risk behaviors change after disaster?

- Data Sources:

A public resource for data on aging in America since 1990

**FEMA**

# Health Risk Behaviors Among Older Adults after Disaster

Unadjusted and Adjusted Logit Models				
Model		Effect Size*	(95% CI)	P value
<b>Change in Physical Activity</b>				
Unadjusted		OR=.89	(.84 - .95)	.001
Adjusted		OR=.84	(.79 - .89)	<.001
<b>Increase in weight</b>				
Unadjusted		RRR=1.19	(1.11 – 1.27)	<.001
Adjusted		RRR= 1.21	(1.13 – 1.30)	<.001
<b>Change in Smoking</b>				
Unadjusted		OR=.96	(.87 - 1.06)	.40
Adjusted		OR=.99	(.91 - .1.08)	.92
*OR, RRR				

# Living Through a Disaster Leads to Less Healthy Behaviors

Sue Anne Bell (@sueannebell) *et al.* PreHospital and Disaster Medicine (In Press).

In a national longitudinal cohort

using Health and Retirement Study data (@HRSisr) combined with Federal Emergency Management Agency disaster declaration data

Comparing those who experienced a disaster versus those who did not

1,451 unique disasters  
60% exposed

16% less likely to be physically active

21% more likely to gain weight

adjusted odds ratio, change over time in health risk behaviors adjusting for many potential confounders

# **Cancer Survival after Disaster**

Sue Anne Bell, PhD, FNP-BC; Theodore J. Iwashyna, MD, PhD;  
Jennifer Griggs, MD, MPH; Matthew A. Davis, PhD

## **Study Objective**

To determine the extent to which exposure to a disaster affects long-term cancer survival.

# Exposure Variable

Cancer cases diagnosed six months before Hurricane Katrina.

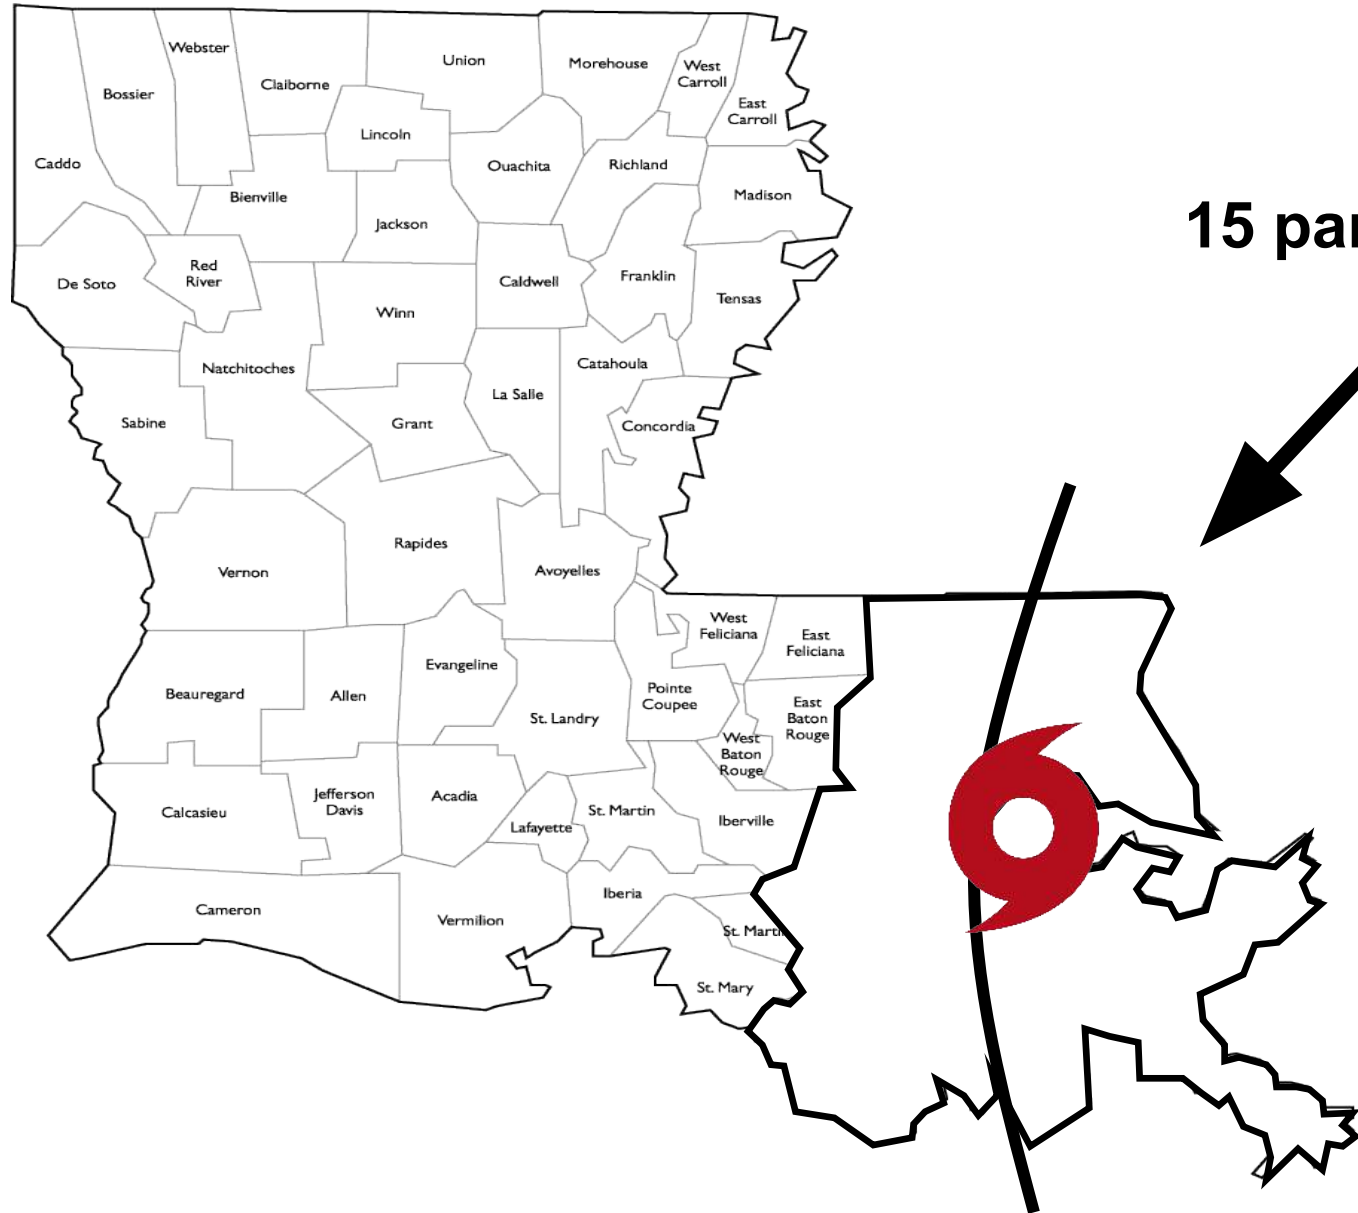

**NATIONAL CANCER INSTITUTE**

**Surveillance, Epidemiology, and End Results Program**

- 19 separate population-based cancer registries across the US
- Louisiana data collection started in 2001
- SEER excluded Louisiana cases after Katrina

**15 parishes included**

**Exposed to Katrina**  
**1,738**

**794 Breast**  
**412 Lung**  
**532 Colorectal**

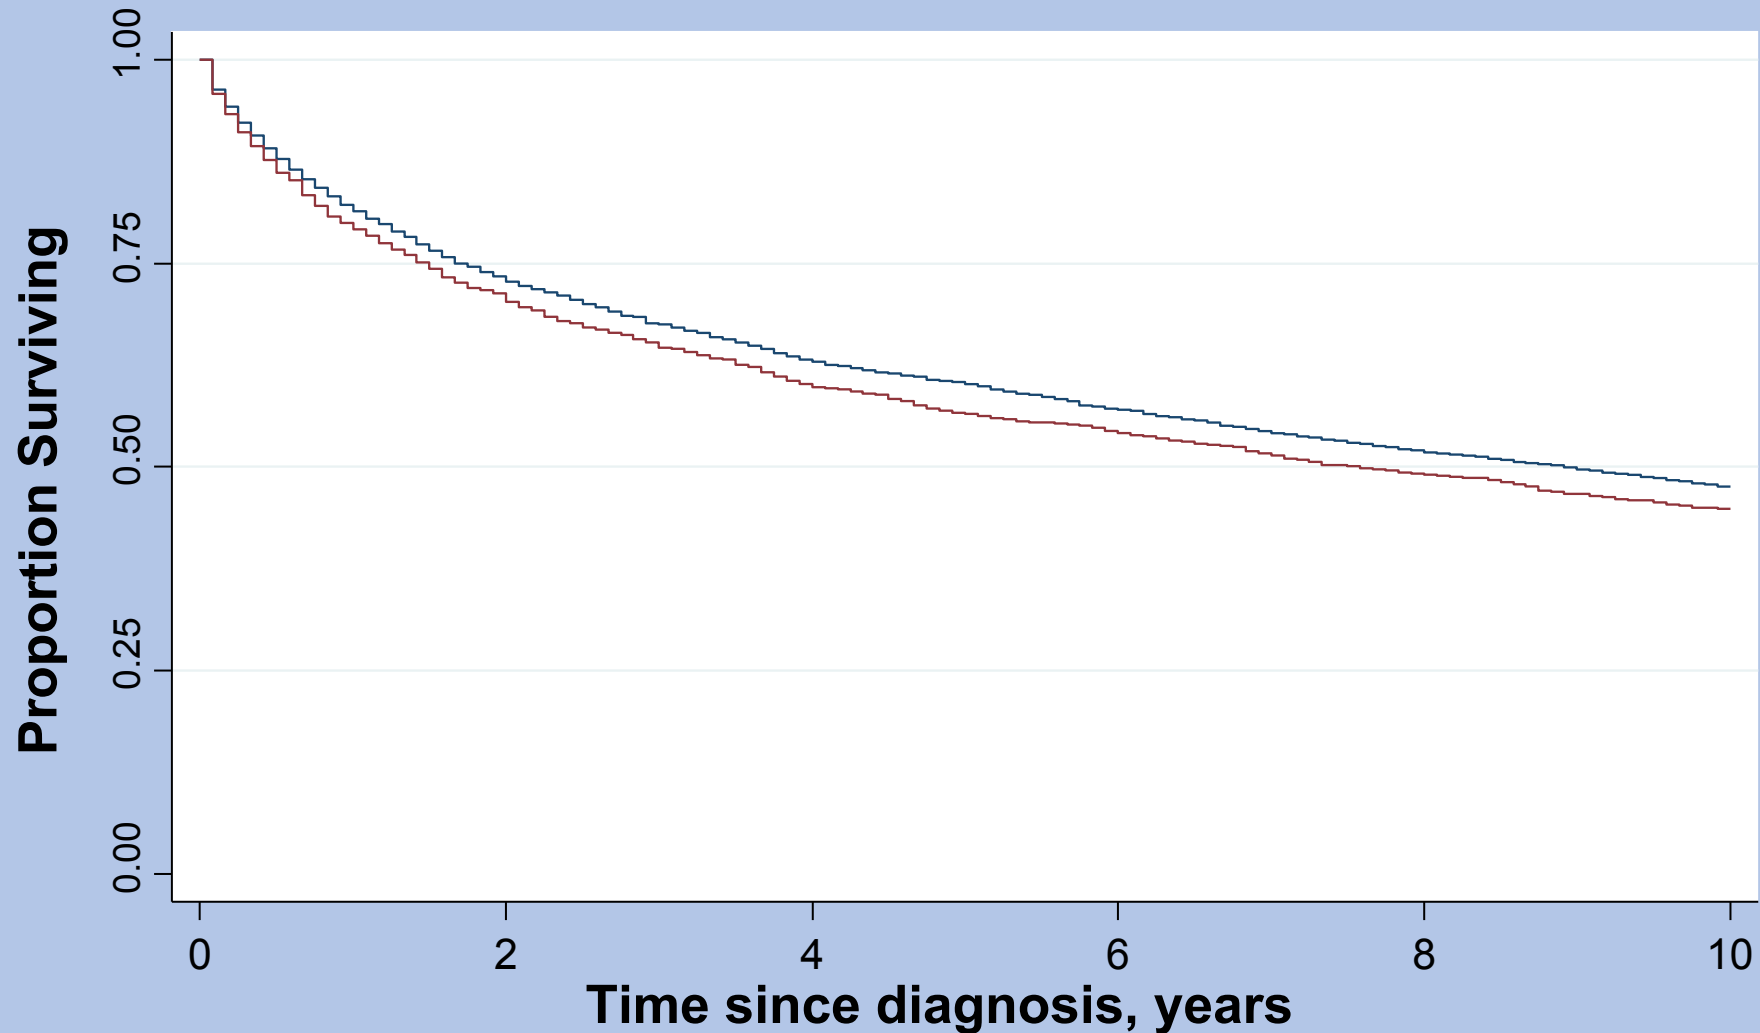

**No Disaster**  
**6,848**

**3,176 Breast**  
**1,648 Lung**  
**2,024 Colorectal**

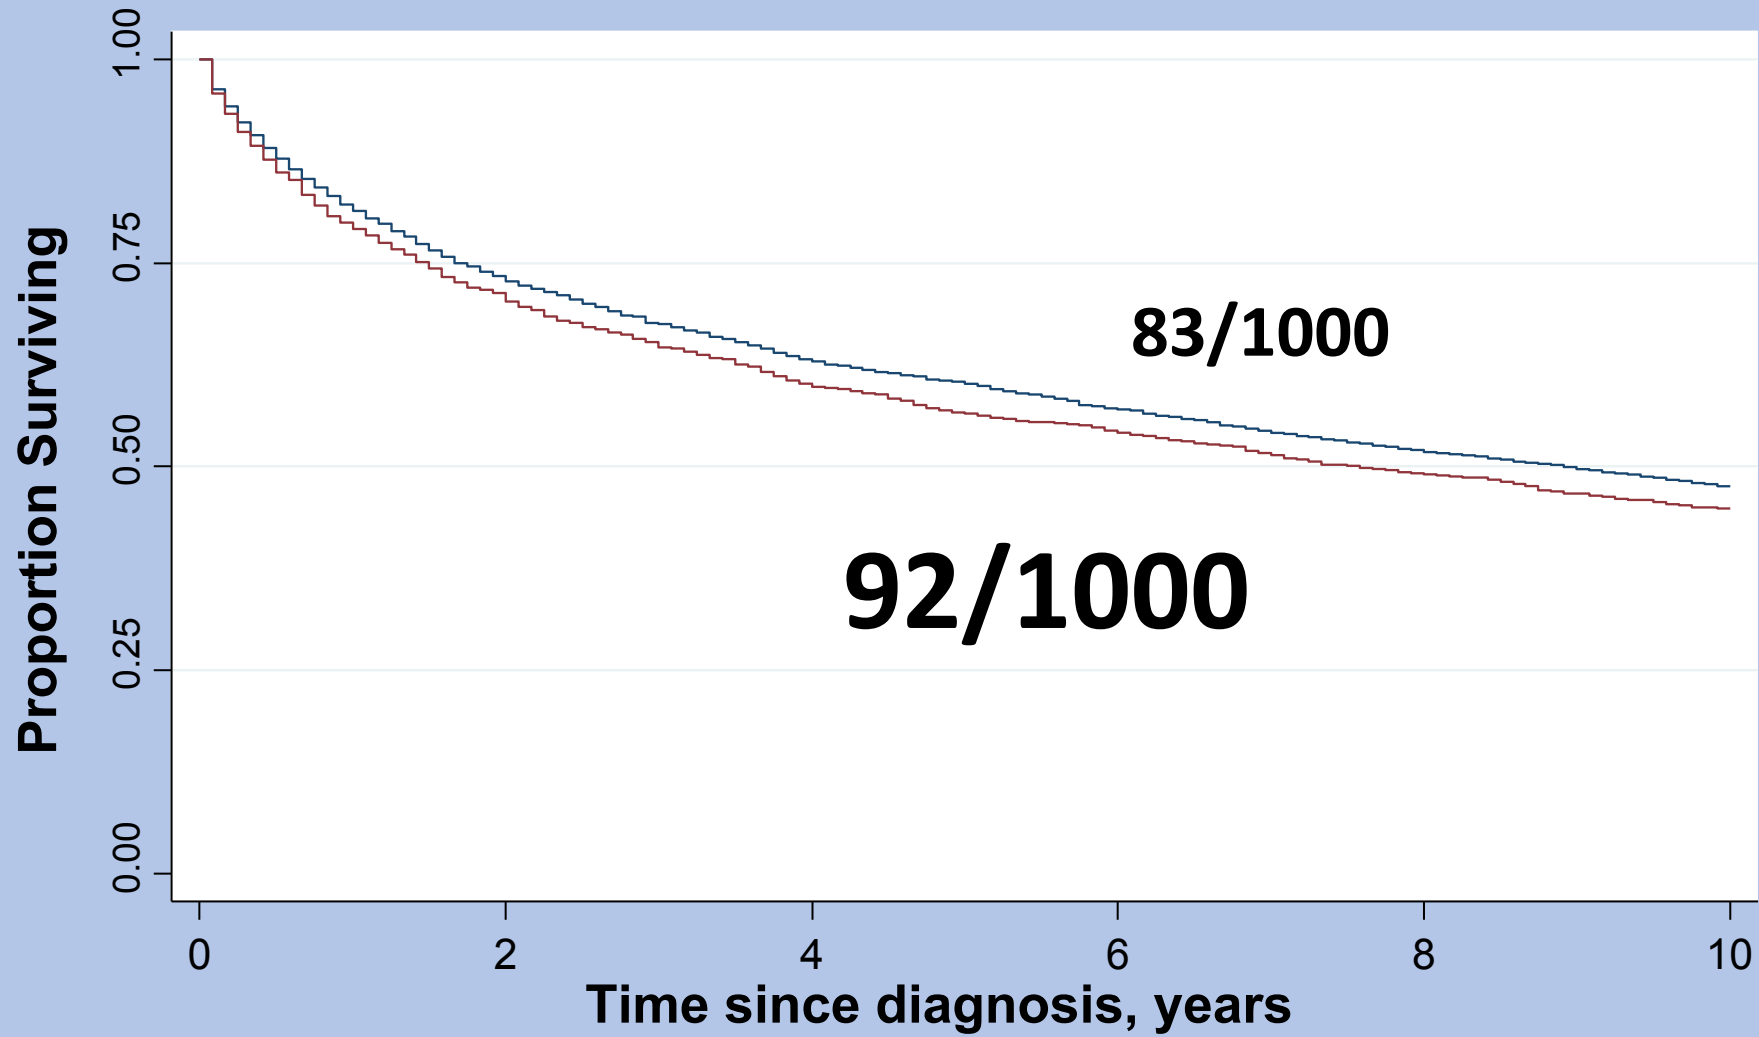

# 1:4 Match

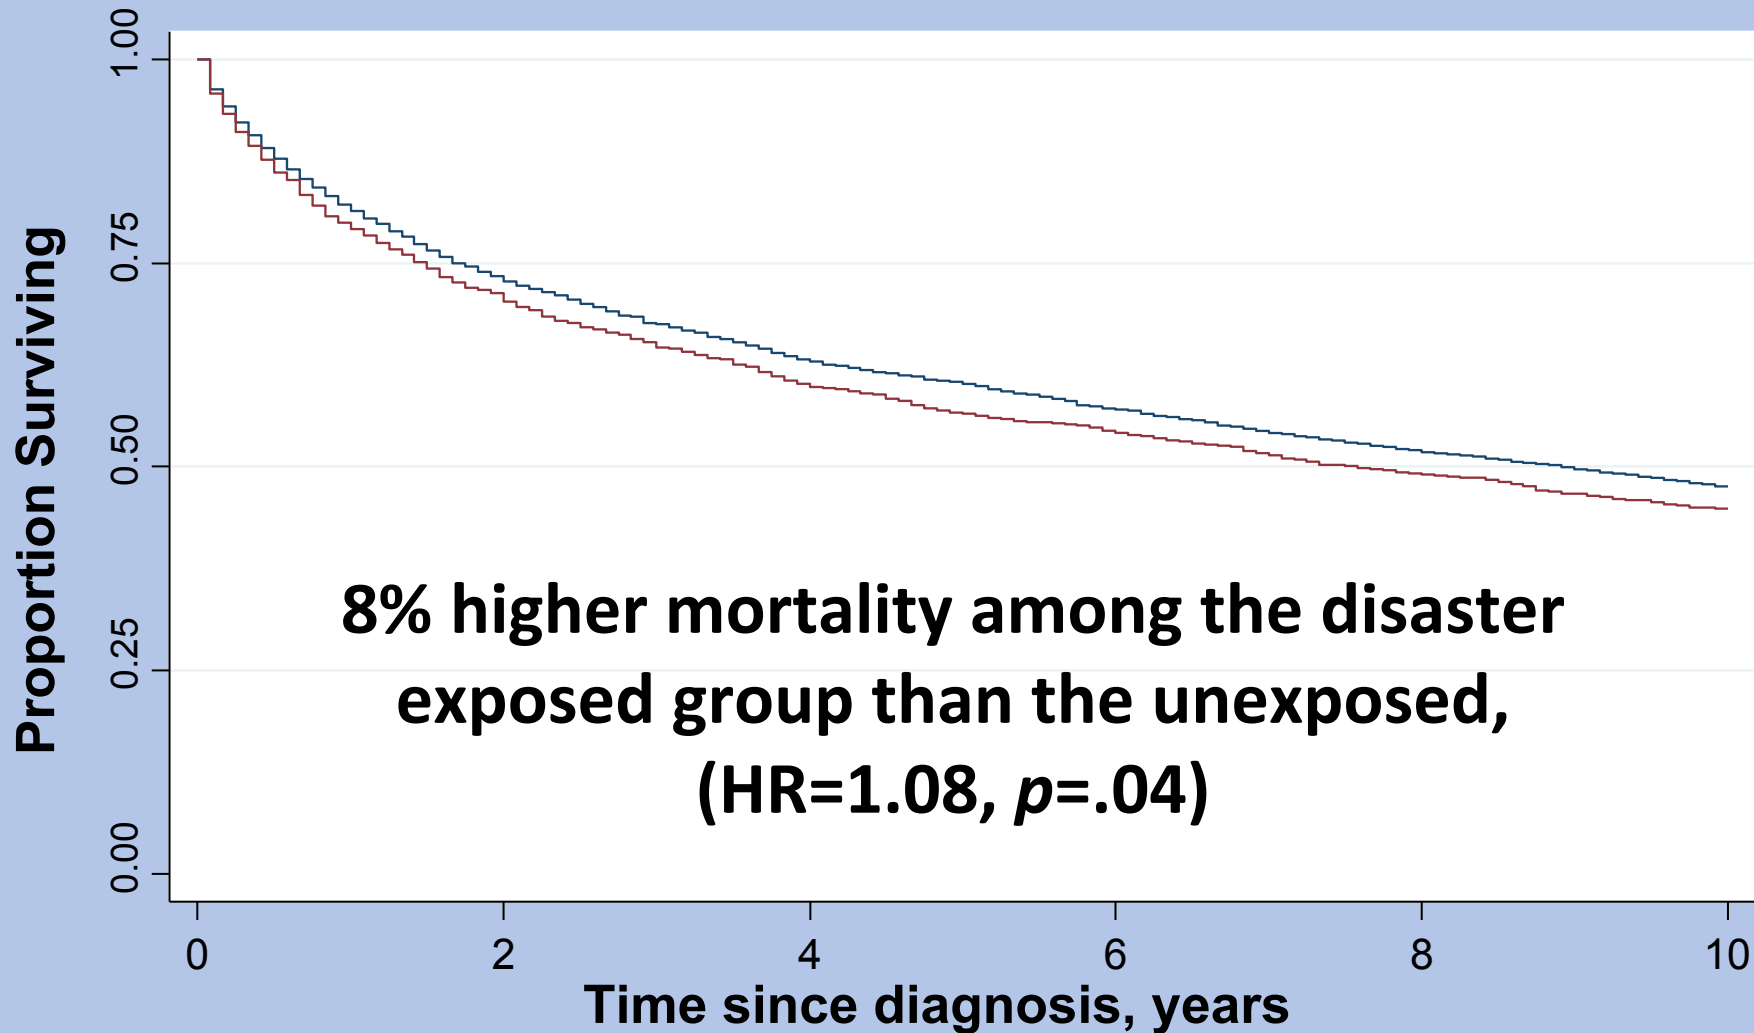

**$p=.02$**

**Overall Time to Mortality**

— Disaster exposure — No disaster exposure

**8% higher mortality among the disaster exposed group than the unexposed, (HR=1.08,  $p=.04$ )**

**Adjusted for:**

- **Cancer stage**
- **Age at diagnosis**
- **Sex**
- **Race/ethnicity**
- **Marital status**
- **Education**
- **Household Income**

**How can we do better?**

“With a shared healthy community vision, strategic planning that prioritizes health, and coordinated implementation, disaster recovery can result in communities that are healthier, more livable places for current and future generations to grow and thrive—communities that are better prepared for future adversities.”

National Academy of Medicine, 2015
